Q1

Project Proposal

20 marks

Present your capstone project proposal by explaining• Project Title• Problem Statement• Objectives• Scope of the Project• Expected OutcomesDeliverables:1. Project Proposal Document2. PPT (5–10 slides)3. Initial Architecture Diagram

Your Answer

Project Title: Unified Web Platform for Stock, Real Estate, and Physical Metals. Problem Statement: Investors struggle to compare and evaluate different asset classes because existing platforms are fragmented and provide limited unified insights. This makes it hard to assess risk, expected returns, liquidity, and overall performance in one place. Objectives: Develop a Java-based web application to track assets across stocks, real estate, and physical metals, and compute an investment score using a Bayesian Network model. Scope: Includes user management, asset data handling, scoring, recommendations, portfolio analysis, and performance reports. Expected Outcomes: Personalized recommendations and data-driven decision support with an easy-to-use

Q2

Existing System Analysis

20 marks

Analyze the existing system related to your project. Explain the limitations, challenges, and justify the need for your proposed solution. Include at least three limitations of the existing system.

Your Answer

Existing investment systems mainly focus on a single asset type such as stocks, real estate, or physical metals, forcing users to switch between different platforms. This makes tracking returns and comparing investments across categories difficult and time-consuming. Most systems provide only basic market information and lack intelligent decision support. As a result, users struggle with limited portfolio analysis, weak risk assessment, and fewer insights into overall performance. Key limitations include no unified platform, no AI-based investment scoring or recommendations, and inadequate comparison and analysis tools. Therefore, a Java-based unified web platform is needed to integrate multiple assets and use a Bayesian Network to generate investment scores for

Q3

Literature Survey

20 marks

Review at least five research papers related to your project. Prepare a comparison table showing the title, methodology, advantages, limitations, and research gap.

Your Answer

A literature survey was conducted by reviewing five research papers related to investment analysis and decision support. "A Survey of Machine Learning Techniques in Stock Market Prediction" by Atsalakis and Valavanis (2023) focuses on stock forecasting using machine learning. "A Survey of Artificial Intelligence in Finance" by Bahrammirzaee (2022) discusses AI applications in financial decision-making. López de Prado (2023) emphasizes portfolio optimization through machine learning. Korb and Nicholson (2024) explain probabilistic decision-making using Bayesian Networks. Mullainathan and Spiess (2023) focus on house price prediction. These studies show existing systems mainly target single asset types, lacking a unified platform; our Java web application

Q4 System Design

20 marks

Present the design of your proposed system by including any three of the following: System Architecture , Datasets

Your Answer

The proposed system is a Java-based web application with a three-tier architecture: presentation, business logic, and database layers. The presentation layer offers registration, login, portfolio management, and investment tracking for stocks, real estate, and physical metals. The business logic layer processes user inputs and applies a Bayesian Network algorithm to compute investment scores using factors like risk, expected returns, market trends, and liquidity, then generates ranked recommendations. The database layer (MySQL) stores user details, asset information, portfolio records, and investment history. Datasets include factor data, historical relationships for conditional probabilities, and asset metadata to support accurate scoring and inference.
